

## HF System

The HF patented self-watering system was first developed in Europe. These planters are manufactured with premium quality materials and ideal for both residential and commercial properties.

The self-watering system was designed for minimum watering. For indoor applications tank only needs to be filled 4 times a year and surface water introduced every 4 to 5 weeks. Watering will obviously vary on plant variety and air temperatures.

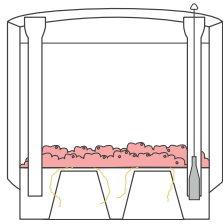

This system works to maintain plants healthier by increasing the circulation of oxygen to both water and roots.

- Patented System
- Easy to Maintain
- Uses less water
- Certified by the Spanish Department of Plant Physiology
- Certified by the Spanish Society of Horticulture

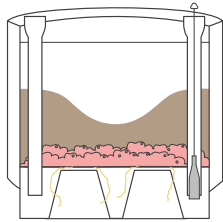

## Easy to Use Planting System

1

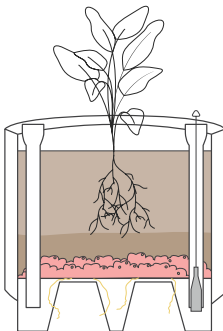

Each planter includes a bag of hydro rocks which should be layered at the bottom before planting. These rocks are porous and will absorb water, maintaining moisture near the plant's root system.

2

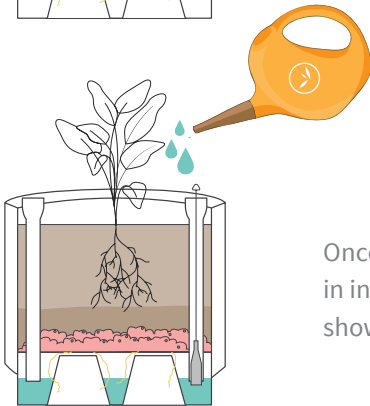

Rocks should be covered with a potting mix selected to complement your plant choice.

3

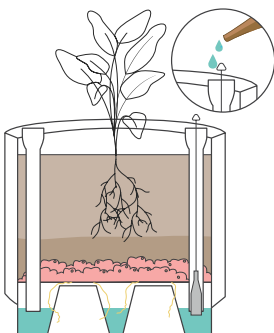

Plant should then be potted making sure to delicately separate roots.

4

Once planted, container should be watered slowly and in intervals, from the top until the water level indicator shows red for full.

5

Maintenance is easy. Fill the tank only 4 times a year and surface water every 4 or 5 weeks.

If using outdoors where planters will receive rain water please consult with us before hand to instruct on how to add an overflow drain.
